

Installation of ELKORA Manager

The ELKORA Manager program is intended for reading data from devices manufactured by ELKORA.

Installing ELKORA Manager:

1. Install the program.
2. Replace the ELKORA.dex file after installation.
3. Start the ELKORA Manager program.
4. Press the "Setup Menu" button in the right corner.
5. Then press the " File – New " key.
6. Enter the counter number in the corresponding window.
7. Manually type the path to the "Base file" position (where the database file will be created).
For example, C:\Program Files\Elkora\Elkora Manager\Data\xxxx.Bsf
We recommend writing the device number instead of xxxx.
8. Press the Modem/Port key.
9. Set the desired com-port number and baud rate (eg 9600). The reading speed must correspond to the speed set on the instrument. Press the "OK" key.
10. Press the "Refresh" button. If the steps are performed correctly (including the correct selection of the exchange rate, as well as the contact number), a moving green bar will appear in the upper right corner. When the reading is complete, the green bar will disappear and "Done" will appear.
